

FOR YOUR CHILD

A simple test can spare your newborn the ravages of undiagnosed Inborn Errors of Metabolism. And give you complete peace of mind...

Inborn Errors of Metabolism (IEM) can be devastating. This group of 50+ metabolic disorders can cause mental retardation, coma, or death. But thanks to advances in technology and scientific know-how, most of these disorders can now be treated with something as simple as a dietary change or addition of a vitamin or supplement – if you know which disorder a child has soon enough. And, soon enough means right at birth!

“NEWBORN SCREENING SAVES LIVES. EVERY BABY MUST BE TESTED.”

**Dr. Jayesh Sheth, Founder
Institute of Human Genetics**

Why is it **important?**

Babies who suffer from IEMs are usually born healthy with no visible sign of illness. In India, these disorders are cumulatively detected in three out of 200 babies. If not detected at birth, it may be too late for treatments to have a positive outcome. Ask your pediatrician about newborn screening. You owe it to yourself and your child. **It costs only Rs 3,975.**

Easy & practical!

More than 50 disorders can be detected from one drop of blood which is obtained by performing a painless heel prick on your baby or child. The drop of blood is collected using a kit provided by and sent back to the laboratory. Results are normally communicated to your doctor within 48 hours.
